# 2025 Digital IC Design

### **Homework 4: Atrous Convolution with Bus Interface**

### 1. Introduction:

Atrous convolution is a technique that expands the kernel by inserting holes between its consecutive elements. In simpler terms, it is a special type of convolution that involves pixel skipping to expand the receptive field without increasing parameters. For example, a 3x3 atrous convolution kernel with the hyperparameter **dilation**=2 can have the same receptive field as a 5x5 regular convolution kernel. By altering the hyperparameter **dilation**, atrous convolution can capture features at multiple scales. Moreover, atrous convolution can reduce the spatial resolution loss compared with regular convolution. Atrous convolutions have been used successfully in various applications, such as semantic segmentation, where a larger context is needed to classify each pixel, and audio processing, where the network needs to learn patterns with longer time dependencies.

In this homework, you are requested to design a two-layered atrous convolutional circuit. The effect of the atrous convolution layer is shown in Figure 1. The input image size is fixed as 64x64. Layer 0 consists of padding, atrous convolution, and ReLU operations. While Layer 1 scales the feature map from Layer 0 to the size of the output image (32x32) with the max-pooling operation, and rounds up the results to the nearest integers. More detailed circuit functionalities will be described in the subsequent sections.

After finishing the atrous convolution circuit, an AXI-liked bus interface is asked to be design to connect the atrous convolution circuit with other three slave interfaces. The system contains a master interface, a 16-bit AXI-liked bus, and three slave interfaces which is one image ROM and two SRAM.

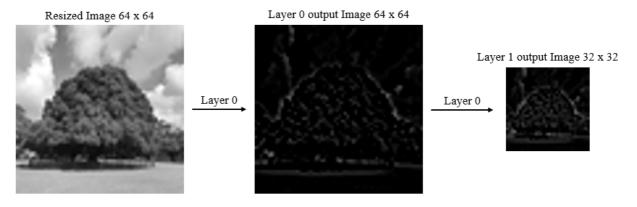

Figure 1. Atrous convolution example.

# 2. ATCONV Design Specifications:

### 2.1 Block Overview:

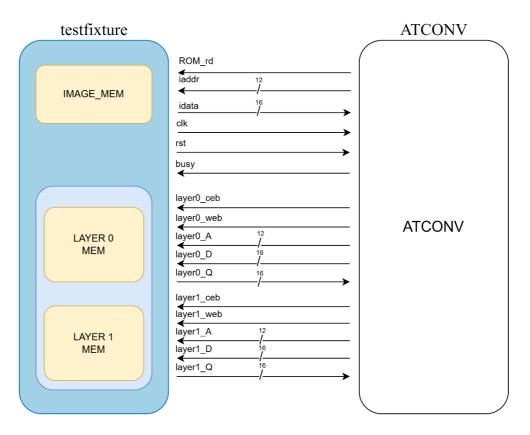

Figure 2. Block Diagram

## 2.2 I/O Interface:

Signal Name	I/O	width	Description
clk	I	1	System clock signal. This system is synchronized at the positive edge of the clock.
rst	I	1	Active-high asynchronous reset signal.

ROM_rd	О	1	Image memory read enable signal. When high, indicates the ATCONV requests data from the Host.
iaddr	О	12	Image memory address signal. Specifying the address of the requested grayscale image pixel.
idata	I	16	Input pixel data of the grayscale image. The pixel data consists of 12-bit integer part (MSB) and 4-bit fractional part (LSB). The testfixture will send the data whose memory address is <i>iaddr</i> with <i>idata</i> port to ATCONV circuit.
layer0_ceb	О	1	LAYER_0_MEM chip enable signal. When high, indicates the LAYER_0_MEM is available for read and write operations.
layer0_web	0	1	LAYER_0_MEM read/write select signal. When High, it indicates that ATCONV is reading data from LAYER_0_MEM; otherwise, it indicates writing data to LAYER_0_MEM.
layer0_A	0	12	LAYER_0_MEM address bus. The ATCONV uses this bus to specify the address in the Host's LAYER_0_MEM where the grayscale image data should be read or written.
layer0_D	О	16	LAYER_0_MEM input data bus. The ATCONV uses this bus to write image data into the Host's LAYER_0_MEM.
layer0_Q	I	16	LAYER_0_MEM output data bus. The Host's LAYER_0_MEM uses this bus to output image data to the ATCONV.
layer1_ceb	О	1	LAYER_1_MEM chip enable signal. When high, indicates the LAYER_1_MEM is available for read and write operations.
layer1_web	О	1	LAYER_1_MEM read/write select signal. When High, it indicates that ATCONV is reading data from LAYER_1_MEM; otherwise, it indicates writing data to LAYER_1_MEM.
layer1_A	О	12	LAYER_1_MEM address bus. The ATCONV uses this bus to specify the address in the Host's LAYER_1_MEM where the grayscale image data should be read or written.

layerl_D	O	16	LAYER_1_MEM input data bus. The ATCONV uses this bus to write image data into the Host's LAYER_1_MEM.
layer1_Q	I	16	LAYER_1_MEM output data bus. The Host's LAYER_1_MEM uses this bus to output image data to the ATCONV.
done	O	1	When the ATCONV completes writing to LAYER_0_MEM and LAYER_1_MEM, it sets done to high to indicate completion.

Table I. I/O interface of ATCONV

### 2.3 Function Description:

#### 2.3.1 Atrous convolutional circuit behavior overview

Input image is a 64 x 64 grayscale image stored in the IMAGE\_MEM. In Layer 0, there are three main tasks to accomplish.

- 1. Replicate padding the 64x64 grayscale input image to 68x68. This operation enables the output feature map of atrous convolution to maintain the same image size.
- 2. Apply atrous convolution to the padded grayscale image
- 3. Implement ReLU function on the result of astrous convolution

The result of Layer 0 should be saved in Layer 0 MEM.

In Layer 1, there are two main tasks to accomplish.

- 1. Max-pooling the output of Layer 0 (stride=2, kernel\_size=2x2)
- 2. Round up the result of Max-pooling to the nearest integer

The result of Layer 1 should be saved in Layer 1 MEM.

The testfixture would check the values in Layer 0 MEM and Layer 1 MEM after *done* signal is set to high.

Notice: The input data and golden results of Layer 0 and Layer 1 all consist of 12-bit integer part (MSB) and 4-bit fractional part (LSB). However, you may need to use register larger than 16 bits to store the intermediate calculation results.

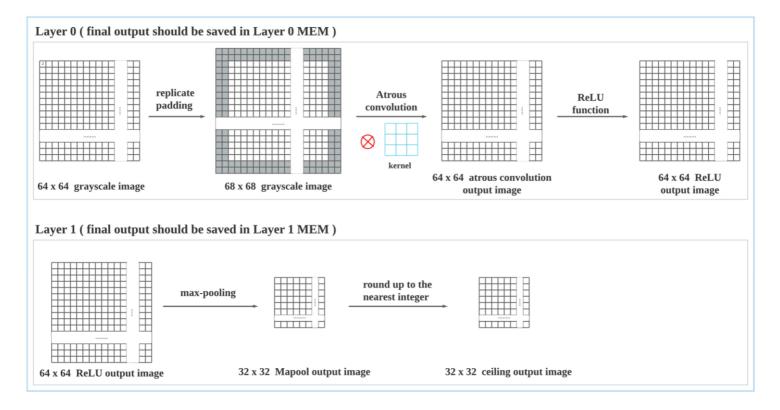

Figure 3. Atrous convolutional circuit behavior overiew

### 2.3.2 Memory Mapping Relations

### 1. Relation between input grayscale image and IMAGE MEM

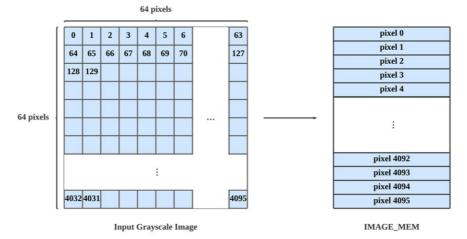

Figure 4. Input Grayscale Image memory mapping

### 2. Relation between Layer 0 results and Layer 0 MEM

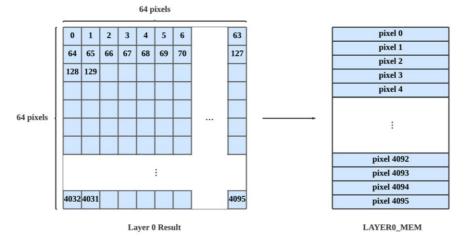

Figure 5. Layer 0 result memory mapping

### 3. Relation between Layer 1 results and Layer 1 MEM

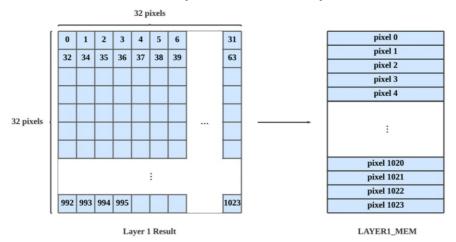

Figure 6. Layer 1 result memory mapping

### 2.3.3 Replicate padding operation:

To maintain the same image size (64x64) after atrous convolution, replicate padding the input grayscale image to 68x68 is required. Below is an example of how replicate padding works on the grayscale image. When the padding parameter is 1, the values at the original boundary would be replicated to form the new boundary. When the padding parameter is 2, the replication operation will be conducted two times to create two new pixels at each side on the boundary. The 3x3 image in the example becomes 7x7 after the padding operation with padding parameter is 2.

In this assignment, the padding parameter is set as 2. The 64x64 image will become 68x68 after the replicate padding operation.

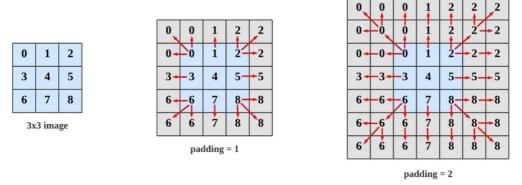

Figure 7. replicate padding example

#### **2.3.4 Atrous Convolution:**

The hyperparameter **dilation** controls the spacing between the convolved points. The atrous convolution with **dilation** is 1 is the same as the regular convolution. The hyperparameter **stride** indicates the step of shifting window, the shifting window will move by n pixels when **stride** is n.

For the atrous convolution operation in this homework, the hyperparameter **dilation** is set as 2 and **stride** is set as 1. The following example will use a 3x3 kernel as an illustration, with the hyperparameter **dilation** is 2 and **stride** is 1. The atrous convolution would be implemented on the padded image of size 7x7.

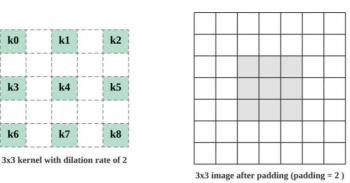

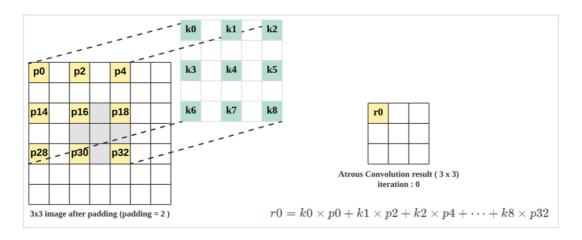

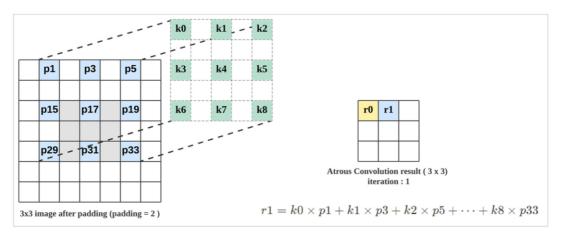

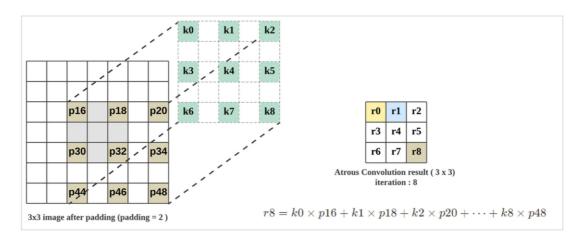

Figure 8. Kernel and image used in example

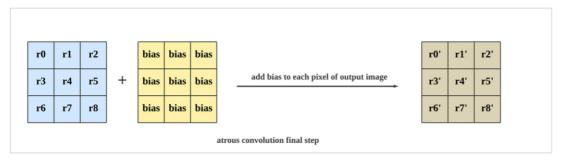

Figure 9. Atrous convolution example on 7x7 padded image (iteration 0, 1, 8)

Figure 9 shows the atrous convolution process, which will scan the whole image from left to right, from top to bottom with a shifting window. The pixel values in the window will convolve with the values of the kernel. From the example in Figure 9, it can be seen the output of atrous convolution has the same size (3x3) as the original input image, which result from the padding operation. Figure 10 shows the kernel values and bias value used in this homework. The kernel values and bias value consist of 12-bit integer part (MSB) and 4-bit fractional part (LSB), and the MSB represents sign bit.

bias:	16'hFFF4		bias:	-0.75	
16'hFFFF	16'hFFFE	16'hFFFF	-0.0625	-0.125	-0.0625
16'hFFFC	16'h0010	16°hFFFC	-0.25	1	-0.25
16'hFFFF	16'hFFFE	16'hFFFF	-0.0625	-0.125	-0.0625

Figure 10. Kernel and bias used in this assignment

#### 2.3.5 ReLU Function:

Kernal and bias used in this assignment( hexadecimal )

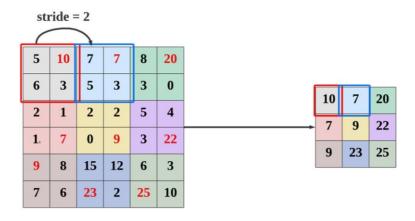

In the last step of Layer 0, ReLU function is applied to the output of atrous convolution. The definition of ReLU function is shown below, which assigns 0 to the non-positive value.

Kernal and bias used in this assignment( decimal )

$$y = \begin{cases} x (x > 0) \\ 0 (x \le 0) \end{cases}$$

## 2.3.6 Max-pooling Example:

Max-pooling is adopted in the first step of Layer 1. How max-pooling works is shown in Figure 11 below. In this homework, the kernel size of max-pooling is 2x2 and the hyperparameter **stride** of max-pooling is 2. The example below adopts the same hyperparameters used in this homework.

max-pooling example ( kernel size 2x2, stride 2 )

Figure 11. Max-pooling example

## 2.4. Timing Specifications:

### 2.4.1 IMAGE MEM data reading control

After the input grayscale image is ready, ATCONV circuit can retrieve data with *iaddr* and *idata* ports. Assign the address of requiring data to *iaddr* at the positive edge of *clk*, and the retrieved data will be transmitted to ATCONV circuit at the negative edge of *clk*. Therefore, ATCONV circuit can get the retrieved data at the next positive edge of *clk*.

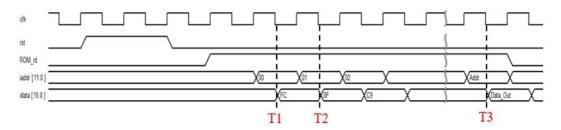

Figure 13. input image pixel retrieval control

## 2.4.2 Layer 0/1 MEM data reading control

When the <code>layer0/1\_web</code> signal is set to 1, ATCONV circuit can read data from the Layer 0/1 memory. After assign the data address with <code>layer0/1\_A</code> port at the positive edge of <code>clk</code>, the testfixure would transmit the corresponding data to the <code>layer0/1\_Q</code> port at the negative edge of <code>clk</code>. Therefore, ATCONV circuit can get the data at the next positive edge of <code>clk</code>.

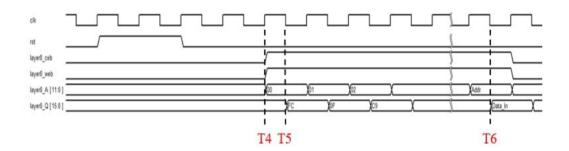

Figure 14. memory data reading control

### 2.4.3 Layer 0/1 MEM data writing control

When the *layer0/1\_web* signal is set to 0, ATCONV circuit can write data into the Layer 0/1 memory. Assign the data address and the data to *layer0/1\_A* and *layer0/1\_D* at the positive edge of *clk*, the data would be written to the corresponding address of the selected memory at the negative edge of *clk*.

bus_clk	I	1	System clock signal. This system is synchronized at the positive edge of the clock.
bus_rst	I	1	Active-high asynchronous reset signal.
ADDR_S	I	12	Slave address channel.
BLEN_S	I	4	Slave burst length, range from 1 to 4.
RDATA_S	О	16	Slave read data channel to master.
RLAST_S	О	1	Slave read last signal to master. This signal indicates the last transfer in a read burst.
RVALID_S	I	1	Slave read valid signal from master.
RREADY_S	О	1	Slave read ready signal.
WDATA_S	I	16	Slave write data channel from master.
TITL ACTUAL	_	1	Slave write last signal. This signal indicates the
WLAST_S	I	1	last transfer in a write burst.
WVALID_S	I	1	Slave write valid signal from master.
WREADY_S	О	1	Slave write ready signal.
SRAM_D	О	16	SRAM data in bus.
SRAM_A	О	12	SRAM address bus.
SRAM_Q	I	16	SRAM data out bus.
SRAM_ceb	0	1	SRAM chip enable. Active high.
SRAM_web	O	1	SRAM write enable. When this signal is 1, it indicates read SRAM; while 0, it indicates write SRAM.
		ROM	_Wrapper (Slave 0)
bus_clk	I	1	System clock signal. This system is synchronized at the positive edge of the clock.
bus_rst	I	1	Active-high asynchronous reset signal.
ADDR_S	I	12	Slave address channel.
BLEN_S	I	4	Slave burst length, range from 1 to 4.
RDATA_S	О	16	Slave read data channel to master.
RLAST_S	О	1	Slave read last signal to master. This signal indicates the last transfer in a read burst.
RVALID_S	I	1	Slave read valid signal from master.
RREADY_S	О	1	Slave read ready signal.
ROM_rd	О	1	ROM read enable signal.
ROM_A	О	12	ROM address bus.
ROM_Q	I	16	ROM data out bus.

Module	Instance	ID
ROM_Wrapper	Slave_0	0
SRAM_Wrapper	Slave_1	1
SRAM_Wrapper	Slave_2	2
Default Slave		3

### 3.3 Bus Interface Specification

#### **♦** Handshake

In this assignment, system read/write operation should be done via AXI-liked bus interface while valid/ready handshake is the most vital action to activate the data transaction. Therefore, there are two types of handshake process in this assignment which is read channel handshake and write channel handshake. In this assignment, for simplicity, ready signal depends on valid signal which implies that slave interface is controlled by master interface. Namely, the valid signal in this assignment should always be pulled high before ready is set to 1, below figure will show the behavior of the handshake process.

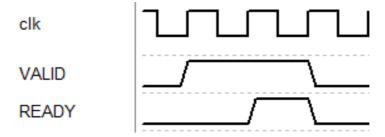

Figure 17. Handshake process

#### **♦** Read Transaction

In this assignment, master interface should be able to read data from different slave interfaces. While system operating read transaction, address, slave ID and burst length settings should be prepare before read channel handshake, these data will then be sent from master to slave interface via bus interface. While the amount of data read from slave interface is equivalent to the burst length, read last signal should be pull high immediately.

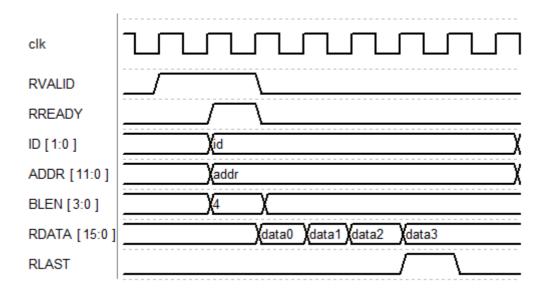

Figure 18. Read transaction

#### **♦** Write Transaction

In this assignment, master interface should be able to write data into different slave interfaces. While system operating write transaction, address, slave ID and burst length settings should be prepare before write channel handshake, these data will then be sent from master to slave interface via bus interface. While the amount of data written into slave interface is equivalent to the burst length, write last signal should be pull high immediately.

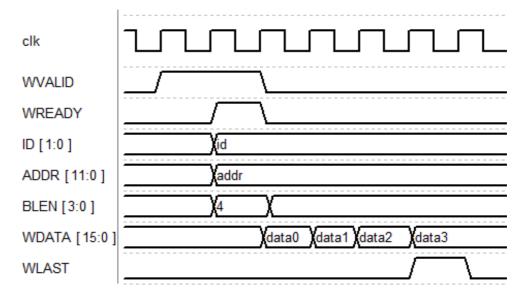

Figure 19. Write transaction

# 4. File Description:

File Name	Description			
	file/ATCONV/			
ATCONV.v	The top module of ATCONV.			
testfixture.sv	The testbench file. You can only change the pattern number, CYCLE and END_CYCLE.			
	file/ATCONV/dat/tb1~tb3/			
img.dat	Input grayscale image data.			
layer0_golden.dat	Golden data of layer 0 output results.			
layer1_golden.dat	Golden data of layer 1 output results.			
	file/ATCONV/mem/			
SRAM.sv	Static random-access memory for ATCONV.			
ROM.sv	Read-only memory for ATCONV.			
	file/System/			
ATCONV_Wrapper.v	System master interface of ATCONV.			
BUS.v	System bus interface.			
top.v Top module of the entire system.				
testfixture.sv	The testbench file. You can only change the pattern number, CYCLE and END_CYCLE.			
file/System/dat/tb1~tb3/				
img.dat	Input grayscale image data.			
layer0_golden.dat	Golden data of layer 0 output results.			
layer1_golden.dat	Golden data of layer 1 output results.			
file/System/include/				
define.v	Parameter definition file. You can only append your parameter definition.			
	file/System/mem/			
SRAM_Wrapper.v	System slave interface of layer 0/1 SRAM.			
ROM_Wrapper.v	System slave interface of image ROM.			
SRAM.sv	Static random-access memory instance.			
ROM.sv	Read-only memory instance.			

Table IV. File structure and description

# 5. Scoring:

# 5.1 ATCONV [60%]

# **♦** Functional Simulation [40%]

All of the result should be generated correctly, and you will get the following message in ModelSim simulation. The functional simulation results of Layer 0 and Layer 1 take 20% of the score each.

```
Congratulations! Layer 0 data have been generated successfully! The result is PASS!!

Congratulations! Layer 1 data have been generated successfully! The result is PASS!!

terminate at 51212 cycle

** Note: $finish : C:/Users/M18131507/Documents/DICLAB/DIC_2025/2025/homework/HW4/ATCONV/testfixture.sv(224)
    Time: 2560600 ns Iteration: 0 Instance: /testfixture
```

Figure 20. Functional simulation result example

### **♦** Pre-Layout Simulation [20%]

### ✓ Synthesis:

Your code should be synthesizable. After it is synthesized in Quartus, a file named ATCONV.vo will be obtained.

# **DEVICE**: Cyclone IV E - EP4CE55F23A7

#### ✓ Simulation:

All of the results should be generated correctly using ATCONV.vo, and you will get the following message in ModelSim simulation. In this homework, the clock width is fixed at 50 ns. The synthesized circuit has to be able to pass simulation with the specified clock width. The prelayout simulation results of Layer 0 and Layer 1 take 10% of the score each.

```
Congratulations! Layer 0 data have been generated successfully! The result is PASS!!

Congratulations! Layer 1 data have been generated successfully! The result is PASS!!

terminate at 51212 cycle

*** Note: $finish : C:/Users/M18131507/Documents/DICLAB/DIC_2025/2025/homework/HW4/ATCONV/testfixture.sv(224)
    Time: 2560600 ns Iteration: 0 Instance: /testfixture
```

Figure 21. Pre-layout simulation result example

# 5.2 System [30%]

# **♦** Functional Simulation [20%]

All of the result should be generated correctly, and you will get the following message in ModelSim simulation.

# **♦** Synthesis

Your code should be synthesizable. After it is synthesized in Quartus, a file named top.vo will be obtained.

### **DEVICE**: Cyclone IV E - EP4CE55F23A7

# **♦** Pre-Layout Simulation [10%]

All of the results should be generated correctly using top.vo, and you will get the following message in ModelSim simulation. In this homework, the clock width is fixed at 50 ns. The synthesized circuit has to be able to pass simulation with the specified clock width. The pre-layout simulation results of Layer 0 and Layer 1 take 10% of the score each.

All of the result should be generated correctly, and you will get the following message in ModelSim simulation.

# **5.3 Performance [10%]**

The performance is scored by the total logic elements, total registers, total memory bits, and embedded multiplier 9-bit elements your design used in gate-level simulation and the total cycles your design takes to finish the simulation. The performance score will be decided by your ranking in all received homework. Only designs that passed System Pre-Layout Simulation and meet resource limitations will be considered in the ranking. Otherwise, you can't get performance score.

The scoring standard: (The smaller, the better)

Scoring = (Total logic elements + Total register + Total memory bits

- + 9\*Embedded multiplier 9-bit elements) × (Total cycle)
- \* Total logic elements must not exceed 1000

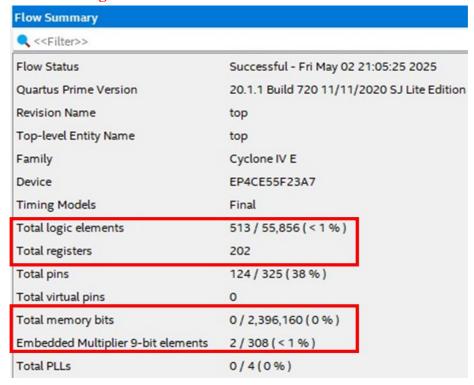

Figure 22. Quartus synthesis result example

#### 6. Submission:

#### 6.1 Submitted files

You should classify your files into three directories and compress them to .zip format. The naming rule is StudentID.zip. If your file is not named according to the naming rule, you will lose five points.

	StudentID/			
	ATCONV/			
	RTL category/			
ATCONV.v	All of your Verilog RTL code			
	Pre-Layout category/			
ATCONV.vo	Pre-Layout netlist generated by Quartus			
ATCONV_v.sdo	Pre-Layout netlist generated by Quartus			
	System/			
	RTL category/			
ATCONV_Wrapper.v	ATCONV master interface.			
SRAM_Wrapper.v	SRAM slave interface.			
ROM_Wrapper.v	ROM slave interface.			
BUS.v	Bus interface.			
Pre-Layout category/				
top.vo	Pre-Layout netlist generated by Quartus			
top_v.sdo	Pre-Layout netlist generated by Quartus			
	Documentary/			
Report.pdf	The report file of your design (in pdf).			

### 6.2 Report file

Please follow the spec of report. You are asked to describe how the circuit is designed as detailed as possible, and the flow summary result is necessary in the report. Please fill the field of total logic elements, total memory bits, embedded multiplier 9-bit elements according to the flow summary (as shown in Figure 22) of your synthesized design. And fill the field of total cycle used according to the prelayout simulation results that Modelsim shows. If the filled-in values don't match your synthesized design or pre-layout simulation results, you will lose 10 points.

#### **6.3** Note

➤ Please submit your .zip file to folder HW4 in moodle.

Deadline: 2025/06/01 23:55

Please don't design specifically for the test pattern. Otherwise, you will get 0

# point. Any plagiarism behavior will also get 0 point.

➤ Late submissions will result in a penalty of 5 points per day.
